## ABSTRACT

This paper provides a sample of a L<sup>A</sup>T<sub>E</sub>X document which conforms, somewhat loosely, to the formatting guidelines for ACM SIG Proceedings. It is an *alternate* style which produces a *tighter-looking* paper and was designed in response to concerns expressed, by authors, over page-budgets. It complements the document *Author's (Alternate) Guide to Preparing ACM SIG Proceedings Using L<sup>A</sup>T<sub>E</sub>X<sub>2 $\epsilon$</sub>  and BibT<sub>E</sub>X*. This source file has been written with the intention of being compiled under L<sup>A</sup>T<sub>E</sub>X<sub>2 $\epsilon$</sub>  and BibT<sub>E</sub>X.

The developers have tried to include every imaginable sort of “bells and whistles”, such as a subtitle, footnotes on title, subtitle and authors, as well as in the text, and every optional component (e.g. Acknowledgments, Additional Authors, Appendices), not to mention examples of equations, theorems, tables and figures.

To make best use of this sample document, run it through L<sup>A</sup>T<sub>E</sub>X and BibT<sub>E</sub>X, and compare this source code with the printed output produced by the dvi file. A compiled PDF version is available on the web page to help you with the ‘look and feel’.

## CCS Concepts

•Computer systems organization → Embedded systems; Redundancy; Robotics; •Networks → Network reliability;

DOI: 10.475/123.4

Concurrent programs are known hard to write and debug. Developers struggle with various of concurrent APIs and subtle concurrent bugs.

In order to understand the We proposed 3 research questions:

**RQ1.** How frequent do concurrent related codes appear in Java open-source projects?

Concurrent programming is very popular in today's Java development with the rapid developments of multi-core techniques which help exploit the power of concurrent programming. Java programming language provides convenient built-in concurrent libraries and users can also invoke third-party libraries. We want to know how frequent do concurrent related codes appear in code repositories.

**RQ2.** Is there any similar changes about concurrent related code?

**RQ3.** What is the relationship between similar code changes and similar contexts?

**RQ4.** How can similar code changes in history guide the new change in development?

The rest of paper is organized as follows: Section 2 presents the methodology of our study. Section 3 presents our result and discussion. Section 4 presents related work. Section 5 presents future work and Section 6 concludes.

## 2. METHODOLOGY

This section presents the methodology of our study. The basic steps are collecting code snippets, extracting changes and calculating similarity.

### 2.1 Project Sources

We investigate 8 Java open-source projects from Github including Hadoop, Tomcat, Cassandra, Lucene-solr, Netty, Flink, Guava and Mahout. They are all popular, large-scale, active, representative Java open-source projects and cover different areas like distributed computing, web server, database, information retrieval, I/O and machine learning. For example, the Hadoop project develops open-source software for reliable, scalable, distributed computing and has become one of the most famous Java open-source software for many years. Table 1 shows the LOC in Java, the number of Java files and the number of commits of each project.

### 2.2 Collecting code snippets

#### 2.2.1 Checking out versions

All the projects of our study are under git which is one of the most popular version control systems in the world. We

**Table 1: Projects information (LOC and #Files are both of Java files)**

Project	LOC	#Files	#Commits	#Contributors
Hadoop	1202764	7701	14930	83
Tomcat	301173	2192	17731	11
Cassandra	387980	2143	21982	191
Lucene-solr	918398	6310	26152	51
Netty	218131	2054	7759	234
Flink	414264	4068	9771	246
Guava	251205	1672	3850	89
Mahout	109584	1215	3703	23

first use "git diff-tree --no-commit-id --name-status -r <commitId>" command to get changed file list of each commit. For each Java source file in the list, we use "git checkout <commitId> - <filename>" and "git checkout <commitId> ^- <filename>" command to check out the old version before the commit and the new version after the commit. Then we extract matching methods of two files base on method name and list of its arguments.

Method-level unit is chosen as the unit of code snippets in our study because file-level unit is too large, whose intrinsic code correlation is not as compact as smaller code unit and which probably contains noises of multiple uncorrelated modifications. More fine-grained level of unit like a group of continuous statements has higher precision and correlation with the modification but is more difficult to identify and implement. Therefore, method-level unit is a practical choice.

### 2.2.2 Preprocessing

Pairs of methods extracted need to be preprocessed. Noticing that a Java class usually has more codes which are mostly class variable declarations outside method definitions, we rewrite the methods to make them more complete without losing the type information defined in the class. We copy a variable declaration into a method if it is referenced in this method. If a local variable in method and a class variable have the same identifiers, the class variable will be renamed to solve the conflict problem. Figure 1 shows an example from .

### 2.2.3 Selecting concurrent related snippets

After we have pairs of code snippets to be further analysed, we present how we select concurrent related snippets. Concurrent related code is a semantic concept. There are too many third-party libraries and user-defined classes that have concurrent related functionalities. So it is hard to select concurrent related code precisely. We use a naive but effective keyword matching method.

A concurrent keyword here is defined as one of the class names or interface names of Java concurrent package and some other concurrent related keywords in Java like 'synchronize' and 'Thread'. Java concurrent package is a common-used concurrent libraries which provide many useful features. It is introduced into Java standard library since Java 1.5. We define a concurrent related snippet as a snippet which contains a concurrent keyword. A pair of snippets is concurrent related if any snippet of the pair is concurrent related. We traverse all the pairs of snippets and reserve those which are concurrent related.

This method might omit some snippets that are concurrent related, but the selected ones are mostly concurrent related snippets indeed.

## 2.3 Extracting changes

We employ a tree based differencing algorithm to extract code changes of matching methods. For a matching pair of methods before and after a modification, the differencing algorithm generates a sequence of edit operations. An edit operation is one of the following types:

## 2.4 Calculating similarity

### 2.4.1 Context similarity

A context is several neighbour statements of change locations. We take the original code that will be changed into consideration. Detecting similar code snippets can use code clone detection techniques. Code clone detection approaches can be categorised into four main categories [6], namely, text or string based approach, lexical or token based approach, tree based approach and semantic approach.

We employ a tree based code clone detecting approach to detect similar code snippets.

We apply machine learning techniques to classify code snippets.

### 2.4.2 Change similarity

**Prepare snippet pairs** Java concurrent package is a common-used concurrent libraries which provide many practical features. We use class name and interface name of the package to selected more than 100000+ concurrent related program snippets modification pairs from 8 popular projects from github. If a program snippet contains any class or interface from java concurrent package, it is considered as a concurrent related program snippet.

**Clustering** We believe that similar program pieces tend to have some similar changes in commit histories. Program pieces are clustered into several group based on concurrent keywords which are class name and interface name from the java concurrent package and 'synchronize'. We use a tfidf model to build a numeric vector for each snippet then employ weka clustering tools including kmeans and em algorithms to cluster the extracted snippets.

## 3. EVALUATION

## 4. RELATED WORK

## 5. FUTURE WORK

We have learned that similar code changes of concurrent related code are common in history of software evolution. This indicates some automatic tools may help developers maintain their code.

## 6. CONCLUSION

We conduct a study on similar code changes of concurrent related code.

## 7. INTRODUCTION

The *proceedings* are the records of a conference. ACM seeks to give these conference by-products a uniform, high-quality appearance. To do this, ACM has some rigid requirements for the format of the proceedings documents: there is a specified format (balanced double columns), a specified set of fonts (Arial or Helvetica and Times Roman) in certain specified sizes (for instance, 9 point for body copy), a specified live area ( $18 \times 23.5$  cm [ $7'' \times 9.25''$ ]) centered on the page, specified size of margins (1.9 cm [ $0.75''$ ]) top, (2.54 cm [ $1''$ ]) bottom and (1.9 cm [ $0.75''$ ]) left and right; specified column width (8.45 cm [ $3.33''$ ]) and gutter size (.83 cm [ $.33''$ ]).

The good news is, with only a handful of manual settings<sup>1</sup>, the L<sup>A</sup>T<sub>E</sub>X document class file handles all of this for you.

The remainder of this document is concerned with showing, in the context of an “actual” document, the L<sup>A</sup>T<sub>E</sub>X commands specifically available for denoting the structure of a proceedings paper, rather than with giving rigorous descriptions or explanations of such commands.

## 8. THE BODY OF THE PAPER

Typically, the body of a paper is organized into a hierarchical structure, with numbered or unnumbered headings for sections, subsections, sub-subsections, and even smaller sections. The command `\section` that precedes this paragraph is part of such a hierarchy.<sup>2</sup> L<sup>A</sup>T<sub>E</sub>X handles the numbering and placement of these headings for you, when you use the appropriate heading commands around the titles of the headings. If you want a sub-subsection or smaller part to be unnumbered in your output, simply append an asterisk to the command name. Examples of both numbered and unnumbered headings will appear throughout the balance of this sample document.

Because the entire article is contained in the `document` environment, you can indicate the start of a new paragraph with a blank line in your input file; that is why this sentence forms a separate paragraph.

### 8.1 Type Changes and Special Characters

We have already seen several typeface changes in this sample. You can indicate italicized words or phrases in your text with the command `\textit`; emboldening with the command `\textbf` and typewriter-style (for instance, for computer code) with `\texttt`. But remember, you do not have to indicate typestyle changes when such changes are part of the *structural* elements of your article; for instance, the heading of this subsection will be in a sans serif<sup>3</sup> typeface, but that is handled by the document class file. Take care with the use of<sup>4</sup> the curly braces in typeface changes; they mark the beginning and end of the text that is to be in the different typeface.

You can use whatever symbols, accented characters, or

<sup>1</sup>Two of these, the `\numberofauthors` and `\alignauthor` commands, you have already used; another, `\balancecolumns`, will be used in your very last run of L<sup>A</sup>T<sub>E</sub>X to ensure balanced column heights on the last page.

<sup>2</sup>This is the second footnote. It starts a series of three footnotes that add nothing informational, but just give an idea of how footnotes work and look. It is a wordy one, just so you see how a longish one plays out.

<sup>3</sup>A third footnote, here. Let’s make this a rather short one to see how it looks.

<sup>4</sup>A fourth, and last, footnote.

non-English characters you need anywhere in your document; you can find a complete list of what is available in the *L<sup>A</sup>T<sub>E</sub>X User’s Guide*[5].

## 8.2 Math Equations

You may want to display math equations in three distinct styles: inline, numbered or non-numbered display. Each of the three are discussed in the next sections.

### 8.2.1 Inline (In-text) Equations

A formula that appears in the running text is called an inline or in-text formula. It is produced by the `math` environment, which can be invoked with the usual `\begin. . . \end` construction or with the short form `$. . . $`. You can use any of the symbols and structures, from  $\alpha$  to  $\omega$ , available in L<sup>A</sup>T<sub>E</sub>X[5]; this section will simply show a few examples of in-text equations in context. Notice how this equation:  $\lim_{n \rightarrow \infty} x = 0$ , set here in in-line math style, looks slightly different when set in display style. (See next section).

### 8.2.2 Display Equations

A numbered display equation – one set off by vertical space from the text and centered horizontally – is produced by the `equation` environment. An unnumbered display equation is produced by the `displaymath` environment.

Again, in either environment, you can use any of the symbols and structures available in L<sup>A</sup>T<sub>E</sub>X; this section will just give a couple of examples of display equations in context. First, consider the equation, shown as an inline equation above:

$$\lim_{n \rightarrow \infty} x = 0 \quad (1)$$

Notice how it is formatted somewhat differently in the `displaymath` environment. Now, we’ll enter an unnumbered equation:

$$\sum_{i=0}^{\infty} x + 1$$

and follow it with another numbered equation:

$$\sum_{i=0}^{\infty} x_i = \int_0^{\pi+2} f \quad (2)$$

just to demonstrate L<sup>A</sup>T<sub>E</sub>X’s able handling of numbering.

## 8.3 Citations

Citations to articles [1, 3, 2, 4], conference proceedings [3] or books [7, 5] listed in the Bibliography section of your article will occur throughout the text of your article. You should use BibTeX to automatically produce this bibliography; you simply need to insert one of several citation commands with a key of the item cited in the proper location in the `.tex` file [5]. The key is a short reference you invent to uniquely identify each work; in this sample document, the key is the first author’s surname and a word from the title. This identifying key is included with each item in the `.bib` file for your article.

The details of the construction of the `.bib` file are beyond the scope of this sample document, but more information can be found in the *Author’s Guide*, and exhaustive details in the *L<sup>A</sup>T<sub>E</sub>X User’s Guide*[5].

This article shows only the plainest form of the citation command, using `\cite`. This is what is stipulated in the

**Table 2: Frequency of Special Characters**

Non-English or Math	Frequency	Comments
Ø	1 in 1,000	For Swedish names
$\pi$	1 in 5	Common in math
\$	4 in 5	Used in business
$\Psi_1^2$	1 in 40,000	Unexplained usage

**Figure 1: A sample black and white graphic.**

SIGS style specifications. No other citation format is endorsed or supported.

## 8.4 Tables

Because tables cannot be split across pages, the best placement for them is typically the top of the page nearest their initial cite. To ensure this proper “floating” placement of tables, use the environment **table** to enclose the table’s contents and the table caption. The contents of the table itself must go in the **tabular** environment, to be aligned properly in rows and columns, with the desired horizontal and vertical rules. Again, detailed instructions on **tabular** material is found in the *LT<sub>ε</sub>X User’s Guide*.

Immediately following this sentence is the point at which Table 1 is included in the input file; compare the placement of the table here with the table in the printed dvi output of this document.

To set a wider table, which takes up the whole width of the page’s live area, use the environment **table\*** to enclose the table’s contents and the table caption. As with a single-column table, this wide table will “float” to a location deemed more desirable. Immediately following this sentence is the point at which Table 2 is included in the input file; again, it is instructive to compare the placement of the table here with the table in the printed dvi output of this document.

## 8.5 Figures

Like tables, figures cannot be split across pages; the best placement for them is typically the top or the bottom of the page nearest their initial cite. To ensure this proper “floating” placement of figures, use the environment **figure** to enclose the figure and its caption.

This sample document contains examples of **.eps** files to be displayable with L<sup>A</sup>T<sub>ε</sub>X. If you work with pdfL<sup>A</sup>T<sub>ε</sub>X, use files in the **.pdf** format. Note that most modern T<sub>ε</sub>X system will convert **.eps** to **.pdf** for you on the fly. More details on each of these is found in the *Author’s Guide*.

As was the case with tables, you may want a figure that spans two columns. To do this, and still to ensure proper “floating” placement of tables, use the environment **figure\*** to enclose the figure and its caption. and don’t forget to end the environment with figure\*, not figure!

## 8.6 Theorem-like Constructs

Other common constructs that may occur in your article are the forms for logical constructs like theorems, axioms, corollaries and proofs. There are two forms, one produced by

**Figure 2: A sample black and white graphic that has been resized with the `includegraphics` command.**

the command `\newtheorem` and the other by the command `\newdef`; perhaps the clearest and easiest way to distinguish them is to compare the two in the output of this sample document:

This uses the **theorem** environment, created by the `\newtheorem` command:

**THEOREM 1.** *Let  $f$  be continuous on  $[a, b]$ . If  $G$  is an antiderivative for  $f$  on  $[a, b]$ , then*

$$\int_a^b f(t)dt = G(b) - G(a).$$

The other uses the **definition** environment, created by the `\newdef` command:

**Definition 1.** *If  $z$  is irrational, then by  $e^z$  we mean the unique number which has logarithm  $z$ :*

$$\log e^z = z$$

Two lists of constructs that use one of these forms is given in the *Author’s Guidelines*.

There is one other similar construct environment, which is already set up for you; i.e. you must *not* use a `\newdef` command to create it: the **proof** environment. Here is an example of its use:

**PROOF.** Suppose on the contrary there exists a real number  $L$  such that

$$\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = L.$$

Then

$$l = \lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} \left[ gx \cdot \frac{f(x)}{g(x)} \right] = \lim_{x \rightarrow c} g(x) \cdot \lim_{x \rightarrow c} \frac{f(x)}{g(x)} = 0 \cdot L = 0,$$

which contradicts our assumption that  $l \neq 0$ .  $\square$

Complete rules about using these environments and using the two different creation commands are in the *Author’s Guide*; please consult it for more detailed instructions. If you need to use another construct, not listed therein, which you want to have the same formatting as the Theorem or the Definition[7] shown above, use the `\newtheorem` or the `\newdef` command, respectively, to create it.

## A Caveat for the T<sub>ε</sub>X Expert

Because you have just been given permission to use the `\newdef` command to create a new form, you might think you can use T<sub>ε</sub>X’s `\def` to create a new command: *Please refrain from doing this!* Remember that your L<sup>A</sup>T<sub>ε</sub>X source code is primarily intended to create camera-ready copy, but may be converted to other forms – e.g. HTML. If you inadvertently omit some or all of the `\defs` recompilation will be, to say the least, problematic.

Table 3: Some Typical Commands

Command	A Number	Comments
<code>\alignauthor</code>	100	Author alignment
<code>\numberofauthors</code>	200	Author enumeration
<code>\table</code>	300	For tables
<code>\table*</code>	400	For wider tables

Figure 3: A sample black and white graphic that needs to span two columns of text.

Figure 4: A sample black and white graphic that has been resized with the `includegraphics` command.

## 9. CONCLUSIONS

This paragraph will end the body of this sample document. Remember that you might still have Acknowledgments or Appendices; brief samples of these follow. There is still the Bibliography to deal with; and we will make a disclaimer about that here: with the exception of the reference to the L<sup>A</sup>T<sub>E</sub>X book, the citations in this paper are to articles which have nothing to do with the present subject and are used as examples only.

## 10. ACKNOWLEDGMENTS

This section is optional; it is a location for you to acknowledge grants, funding, editing assistance and what have you. In the present case, for example, the authors would like to thank Gerald Murray of ACM for his help in codifying this *Author's Guide* and the `.cls` and `.tex` files that it describes.

## 11. ADDITIONAL AUTHORS

Additional authors: John Smith (The Thørväld Group, email: `jsmith@affiliation.org`) and Julius P. Kumquat (The Kumquat Consortium, email: `jpkumquat@consortium.net`).

## APPENDIX

### A. HEADINGS IN APPENDICES

The rules about hierarchical headings discussed above for the body of the article are different in the appendices. In the `appendix` environment, the command `section` is used to indicate the start of each Appendix, with alphabetic order designation (i.e. the first is A, the second B, etc.) and a title (if you include one). So, if you need hierarchical structure *within* an Appendix, start with `subsection` as the highest level. Here is an outline of the body of this document in Appendix-appropriate form:

#### A.1 Introduction

#### A.2 The Body of the Paper

##### A.2.1 Type Changes and Special Characters

##### A.2.2 Math Equations

*Inline (In-text) Equations.*

*Display Equations.*

*A.2.3 Citations*

*A.2.4 Tables*

*A.2.5 Figures*

*A.2.6 Theorem-like Constructs*

*A Caveat for the T<sub>E</sub>X Expert*

## **A.3 Conclusions**

## **A.4 Acknowledgments**

## **A.5 Additional Authors**

This section is inserted by L<sup>A</sup>T<sub>E</sub>X; you do not insert it. You just add the names and information in the `\additionalauthors` command at the start of the document.

## **A.6 References**

Generated by bibtex from your .bib file. Run latex, then bibtex, then latex twice (to resolve references) to create the .bbl file. Insert that .bbl file into the .tex source file and comment out the command `\thebibliography`.

## **B. MORE HELP FOR THE HARDY**

The sig-alternate.cls file itself is chock-full of succinct and helpful comments. If you consider yourself a moderately experienced to expert user of L<sup>A</sup>T<sub>E</sub>X, you may find reading it useful but please remember not to change it.
